

## ABSTRACT OF THE DISCLOSURE

To make it possible to draw an image as intended.

A printing device 1 displays a previewed image on a surface  
5 for printing (printing paper or a surface for pasting a print) to allow the user to preview how content data will be printed. As the user adjusts the previewed image to obtain intended results, an image identical to the image being previewed is printed on the printing paper. This makes it easy to print 10 desired content. Specifically, since the user can verify an image displayed on the surface on which the image will be actually printed or pasted, it is possible to prevent the actual print produced or pasted on the printing paper from differing from the user's expectations.
